Profile Summary

"Experienced full-stack engineer with 7+ years designing scalable systems, optimizing performance, and mentoring teams. Skilled in backend, frontend, and cloud technologies, delivering impactful solutions across fintech, health, and e-commerce."

I am a full-stack software engineer with a degree in computer engineering and over 7 years of professional experience. I specialise in architecting, designing, and developing scalable software systems, building monitoring tools to ensure there are no downtimes, implementing disaster recovery strategies, and writing clean and maintainable code. Through years of experience, I have developed a keen eye for efficiency, consistency, and simplicity in software, combined with an ability to collaborate with others to identify the best solution to complex problems.

Skills & Tools

- Backend & Microservices (Node.js/Typescript, Go, Python, Ruby, Kafka, RabbitMQ)
- Frontend (React, React Native, Redux, GraphQL)
- Persistence (PostgreSQL, MSSQL, SQLite, Oracle, MongoDB, Redis)
- Infrastructure (Docker, Kubernetes, AWS, Terraform)
- Test Automation (Postman, Cypress, Selenium, Jest, Mocha)
- Monitoring (New Relic, Sentry, Kibana)
- CI/CD (Github Actions, Jenkins, CircleCI, Travis CI)

I am also well-versed in system architecture, building scalable applications, performance optimization, and cloud-native solutions. I have expertise in designing, implementing, and maintaining large software systems, as well as mentoring teams and collaborating across functional teams.

Work Experience

Persuasive Computing Lab
Dalhousie University (Canada)
January 2025 - Present

Researcher & Software Engineer (ML, HCI)

My work spans machine learning (ML) and human-computer interaction (HCI), where I design, build, and evaluate ML-driven systems. Key projects include:

- Trained a machine learning model to detect energy smells in source code.
- Designed a movie recommendation system that incorporates metadata into the pipeline of a transformer model.
- Designed, implemented, and evaluated a persuasive educational chatbot that encourages graduate students to actively engage with large language model (LLM) tools, such as ChatGPT, for learning and for critically evaluating research materials, rather than passively copying and pasting content.

The main tools I use across these projects include: Python, Node.js, React, Next.js, and LLMs.

Getir (Türkiye)
May 2021 - June 2025

Senior Software Engineer

I worked on promotions, advertising, and customer retention, implementing solutions that improved system performance and customer engagement. My team and I implemented and managed over 20 microservices, integrating them into the broader platform to enhance scalability and reliability. I refactored legacy code to eliminate technical debt, reduce system response times, and improve application performance. I created technical documentation of our system design on Jira. I mentored junior engineers, helping them deliver high-quality code and grow their skills. The main tools I used at Getir include: Nodejs/Typescript, Golang, NewRelic, Sentry, Kafka, MongoDB, Redis, AWS S3, Elastic Search, React, GraphQL.

Other Skills

Some other useful skills I have gained over the years include:

- **Critical thinking and problem solving skills**
- **Mentorship, Technical Documentation**
- **Technical Leadership skills**
- **Excellent written and verbal communication skills**

POPULAR PROJECTS AND CONTRIBUTIONS

Some of my relevant projects include:

- Getir Yemek: Getir's food delivery service. I worked on the design and implementation of the services for promotion definition, usage, availability, and promotion listing.
- Access Payment Gateway. A payment gateway for Access Bank Nigeria, enabling both local and international payments using VISA, VERVE, and MASTERCARD.
- Nigeria Navy Ship Management System. A Ship management system for the Nigerian Navy responsible for handling ship maintenance requests.
- Integrated Health Insurance Management System (IHIMS) for the for the Nigerian Military, including the Army, Air Force, Navy, and the Tri-service.

Hobbies

I like:

- Comedy
- Traveling
- Soccer

Work Experience

Lighthouse Labs (Canada) — **October 2021 - August 2024**

Software Engineering Mentor (Part Time)

I mentored software engineering interns and bootcamp students by guiding them through full-stack web development projects and helping them strengthen their skills in React, Node.js, and Ruby on Rails. I provided both technical and professional mentorship, assisting students in debugging complex issues, improving their coding practices, and building confidence as developers. I also contributed to curriculum development, refining learning materials to ensure clarity and industry relevance. Other tools I worked with at Lighthouse include: Jest, Mocha, Cypress, PostgresDB.

Access Bank — **December 2019- May 2021**

Full-stack Software Engineer

I designed and built an automated reporting system that securely transmitted account maintenance activities to the Central Bank of Nigeria in real-time. Developed with Node.js/Typescript, RabbitMQ, cron jobs, and ReactJS, the platform was successfully updating over 40 million records monthly, with high reliability and accuracy. On another project, I designed and implemented the backend system for the bank's payment gateway, which powers millions of transactions across platforms such as Paystack, Woven Finance, and Flutterwave. Other tools used: Kafka, RabbitMQ, Redis, New Relic, Azure, and a host of databases such as Oracle, MySQL, MsSQL, and PostgreSQL.

Andela (Remote) — **December 2018 - October 2019**

Full Stack Web Developer

I worked on a full-stack Ruby on Rails application that streamlined Andela's decision-making process for hiring software engineers. My responsibilities included designing and implementing backend features, optimizing database queries, and developing front-end components to improve the user experience. I also worked on Authors Haven, a full-stack publishing platform modeled after Medium, with a Node.js, Typescript, ReactJS, and Postgres stack. I developed and integrated RESTful APIs, implemented user authentication and content management features, and built reusable UI components to enhance usability. My roles included optimizing API endpoints, debugging complex bugs, and collaborating with teammates to create and refine tasks.

Work Experience

Eregen Technology (Remote) **November 2018 - April 2021**

Full Stack Web Developer (Consultancy)

I served as the backend lead engineer for two enterprise-scale applications adopted at a national scale:

- Health Insurance System (DHML): Designed and implemented a robust backend solution using Node.js/Typescript and MySQL, supporting over 90,000 enrollees. I designed and implemented the solution to patient enrollment, claims management, and reporting.
- Ship Maintenance System (Nigerian Navy): Led the design and backend development of a Node.js/Typescript + PostgreSQL system that streamlined ship maintenance requests, tracked machinery runtime, and automated service reporting. I built and maintained APIs consumed by the React frontend, ensuring scalability, data accuracy, and real-time updates.

For both projects, I was responsible for system architecture, backend implementation, API design and testing, deployment, and documentation.

Education

Dalhousie University
Nova Scotia, Canada

Master of Computer Science (MSC) **2025**

Nnamdi Azikiwe University
Anambra State, Nigeria

Bachelor of Engineering (B.Eng) **2026**

Relevant Trainings

Applied Data Science I: Scientific Computing & Python **2022**
